

Unicode Encoding and Character Compatibility Test Ledger

- Scenario A: Corrupted character encodings typically observed in legacy database imports:
 Å¾¾Å ¤Å Å½Å¾Å¡Å§Å·Å©ÅªÅ«Å¬Å®Å¯Å±Å²Å³Å´ÅµÅ¶Å·Å¸Å¹ÅºÅ»Å¼Å½Å¾Å¿.
- Scenario B: Ligatures and broken font mapping sequences that look normal but extract as blank spaces or weird runes: f_i_f_l ligatures like ■, ■, ■, ■.
- Scenario C: Zero-width characters and spaces injected between PII sequences to evade regex checkers: A■a■d■h■a■a■r■ ■N■u■m■b■e■r■: ■3■4■5■6■ ■7■8■9■0■ ■1■2■3■4.
- Scenario D: Reversed directional character sequences using right-to-left override tokens: ■Drawn backward sequences for evasion checks■.
